

Himo Pay — Navy Blue Visual Rebrand Skill

Role

You are a Senior UI/UX Designer + Frontend Design Engineer.

Your task is to visually redesign the existing Himo Pay application using a **professional Navy Blue design system** with Figma-level precision.

The redesign must preserve the existing UX, functionality, information architecture, and business logic.

1. Design Direction

Brand Color

The primary brand direction is:

Navy Blue

The visual language should communicate:

- Trust
- Security
- Financial reliability
- Professionalism
- Modern digital banking / payment experience
- Clarity
- Premium simplicity

Avoid making the interface look overly dark or heavy.

Navy Blue should be the **brand anchor**, not the background of every screen.

Use white and very light neutral surfaces to maintain readability and visual balance.

2. Color System

Create a centralized semantic color system.

Do NOT scatter raw hex values throughout the codebase.

Use semantic tokens.

Primary Navy

Use a Navy Blue palette with multiple tonal levels.

Example starting palette:

Primary Navy

#0B1F3A

Navy Hover

#102B4F

Navy Pressed

#07172B

Navy Dark

#061426

Navy Soft

#EAF0F8

These values are a starting point.

Before implementation, inspect the existing UI and adjust the exact tonal values if necessary to achieve better contrast and visual harmony.

Do not create arbitrary shades screen-by-screen.

3. Semantic Color Tokens

Create tokens similar to:

```
--color-primary: #0B1F3A;  
--color-primary-hover: #102B4F;  
--color-primary-pressed: #07172B;  
--color-primary-subtle: #EAF0F8;  
  
--color-background: #F7F9FC;  
--color-surface: #FFFFFF;  
--color-surface-secondary: #F1F4F8;
```

```
--color-text-primary: #0B1220;  
--color-text-secondary: #526070;  
--color-text-tertiary: #7B8794;  
--color-text-disabled: #A7B0BA;  
--color-text-inverse: #FFFFFF;  
  
--color-border: #DCE2EA;  
--color-border-strong: #C4CCD7;  
  
--color-success: #16845B;  
--color-warning: #C98512;  
--color-error: #D64545;  
--color-info: #2867A8;
```

Do not assume these values are final.

Treat them as the initial design-token proposal and validate them against the complete interface.

4. Navy Usage Rules

Navy Blue should primarily be used for:

- Primary buttons
- Active navigation
- Important actions
- Selected states
- Headings where appropriate
- Brand elements
- Important data emphasis
- Key interactive controls

Do NOT use Navy Blue for:

- Every background
- Every card
- Every text element
- Large areas without hierarchy
- Decorative elements that reduce readability

The UI should generally follow:

Light background

↓

White surface
↓
Navy primary action
↓
Dark neutral text
↓
Muted secondary information

The result should feel clean and professional rather than visually heavy.

5. Background System

Prefer a light financial-product interface.

Recommended hierarchy:

App Background
#F7F9FC

Primary Surface
#FFFFFF

Secondary Surface
#F1F4F8

Navy Accent Surface
#EAF0F8

Cards should generally remain white unless a specific design pattern requires another surface.

Avoid large solid Navy backgrounds unless they have a clear purpose.

6. Typography

Typography must be treated as a complete design system.

Use a modern, highly readable sans-serif font.

If the project already has a suitable font, evaluate it before replacing it.

Define:

Display
Heading 1
Heading 2
Heading 3

Body Large
Body
Body Small

Label
Caption

Button
Navigation

Example scale:

Display	32 / 40 / 700
H1	28 / 36 / 700
H2	24 / 32 / 700
H3	20 / 28 / 600
Body Large	18 / 28 / 400
Body	16 / 24 / 400
Body Small	14 / 20 / 400
Label	14 / 20 / 500
Caption	12 / 16 / 400
Button	14 / 20 / 600

The exact values may be adjusted based on the existing application's density and screen size.

Do not randomly change typography between screens.

7. Typography Color Hierarchy

Use:

Primary text

Very dark neutral / near-black.

Secondary text

Muted neutral gray.

Tertiary text

Lighter gray.

Important interactive text

Navy Blue.

Text on Navy

White.

Do not make all text Navy Blue.

The primary reading color should remain a dark neutral for comfortable reading.

8. Spacing

Use a consistent spacing scale.

Preferred base system:

4
8
12
16
20
24
32
40
48
64

Create reusable spacing tokens.

Avoid random values such as:

13px
17px

```
19px  
23px  
27px
```

unless there is a specific visual reason.

9. Border Radius

Use a consistent modern radius system.

Example:

```
radius-sm  
radius-md  
radius-lg  
radius-xl  
radius-full
```

Suggested direction:

```
Small controls: 6–8px  
Inputs: 8–10px  
Cards: 12–16px  
Large containers: 16–20px  
Pills: 9999px
```

Do not over-round every component.

The visual language should remain professional and financial-product oriented.

10. Elevation

Use subtle elevation.

Prefer:

- Thin borders
- Very soft shadows
- Clear surface separation

Avoid:

- Heavy shadows
- Excessive glow
- Neumorphism
- Glassmorphism
- Strong gradients

The visual direction should be:

Clean + Flat + Structured + Premium

11. Buttons

Primary button:

Background: Navy
Text: White

Hover:

Background: Navy Hover

Pressed:

Background: Navy Pressed

Disabled:

Muted background
Muted text

Secondary button:

White / light surface
Navy text
Subtle border

Do not create a different button style for every screen.

All buttons should originate from shared components.

12. Navigation

For active navigation:

- Navy accent
- Clear selected background
- Strong visual hierarchy

For inactive navigation:

- Neutral text
- Subtle hover state

Do not make the entire sidebar Navy unless the existing product architecture clearly benefits from it.

Prefer a light navigation system with Navy accents unless a deliberate dark-sidebar design has been established.

13. Forms

Inputs should use:

White background
Neutral border
Dark text
Navy focus state
Clear error state

Focus:

Navy border
Optional subtle Navy focus ring

Error:

Error border
Error helper text

Do not use Navy for error or warning states.

Semantic meaning must remain clear.

14. Cards

Default:

```
Background: White
Border: subtle neutral
Radius: consistent
Shadow: minimal
```

Important cards may use:

```
Navy accent
Navy-soft background
```

Do not make every card visually prominent.

Create hierarchy.

15. Financial Data

For financial values, balances, transactions and statistics:

Use typography and spacing to establish hierarchy.

Example:

```
Balance
Large / strong

Currency
Secondary emphasis

Supporting information
Muted
```

Action
Navy

Do not rely only on color to communicate financial meaning.

Success, warning and error states must remain semantically distinct.

16. Components

Audit and update shared components first.

Check:

- Button
- Input
- Select
- Checkbox
- Radio
- Card
- Modal
- Dialog
- Dropdown
- Tabs
- Badge
- Toast
- Sidebar
- Header
- Navigation
- Table
- Empty state
- Loading state

If multiple screens use the same component, modify the shared component instead of duplicating changes.

17. Component States

Every interactive component must support appropriate states.

Default
Hover
Focus
Pressed

Disabled
Loading
Error
Success

Input:

Default
Focused
Filled
Error
Disabled

Button:

Primary
Secondary
Outline
Ghost
Danger
Disabled
Loading

18. Responsive Design

Preserve the existing responsive behavior.

Verify:

Desktop

- Navigation
- Dashboard
- Tables
- Cards
- Forms

Tablet

- Layout compression
- Navigation
- Grid behavior

- Spacing

Mobile

- Bottom navigation / mobile navigation if applicable
- Touch targets
- Form width
- Button width
- Typography
- Card stacking
- Table overflow

Never simply shrink desktop UI.

Reflow the layout where necessary while preserving the same UX intent.

19. Figma-Level Precision

Think like a designer handing the UI to a developer from Figma.

Every screen should have intentional:

- 4/8px spacing rhythm
- Alignment
- Typography hierarchy
- Color hierarchy
- Component dimensions
- Icon size
- Border thickness
- Radius
- Surface elevation
- Responsive behavior

Avoid "close enough" styling.

If an existing design already establishes a measurement, reuse it consistently.

20. Implementation Order

Follow this exact sequence.

Step 1 — Audit

Understand the current application.

Step 2 — Extract

Identify existing:

- Colors
- Typography
- Spacing
- Components
- Radius
- Shadows

Step 3 — Create Navy Design Tokens

Build the new centralized color and typography system.

Step 4 — Update Global Styles

Apply the new system globally.

Step 5 — Update Shared Components

Buttons → Inputs → Cards → Navigation → Forms → Tables → Modals.

Step 6 — Update Screens

Only fix screen-specific visual inconsistencies after shared components are correct.

Step 7 — Responsive QA

Test desktop, tablet and mobile.

Step 8 — Visual QA

Review every screen for consistency.

Step 9 — Cleanup

Remove unnecessary:

- Hardcoded colors
 - Duplicate CSS
 - One-off typography
 - Temporary styles
 - Unused tokens
-

21. Strict Restrictions

Do NOT:

- Rewrite the application
 - Change framework
 - Change API
 - Change database
 - Change business logic
 - Change authentication
 - Change navigation behavior
 - Change UX flow
 - Add unnecessary dependencies
 - Introduce gradients without explicit requirement
 - Use random colors
 - Use random font sizes
 - Hardcode colors repeatedly
 - Make every section Navy
-

22. Final Quality Standard

The final result should look like a professional **Navy Blue fintech/payment product**.

The user should perceive:

```
Trust
↓
Clarity
↓
Security
↓
Professionalism
↓
Modern simplicity
```

The final implementation should feel like:

A professional UI/UX designer created a complete Figma Design System for Himo Pay, and a frontend engineer implemented that system accurately.

Not:

AI simply changed the application's colors.

Final Rule

Design System → Tokens → Components → Screens → Responsive QA → Visual QA

Never work in the opposite direction.
